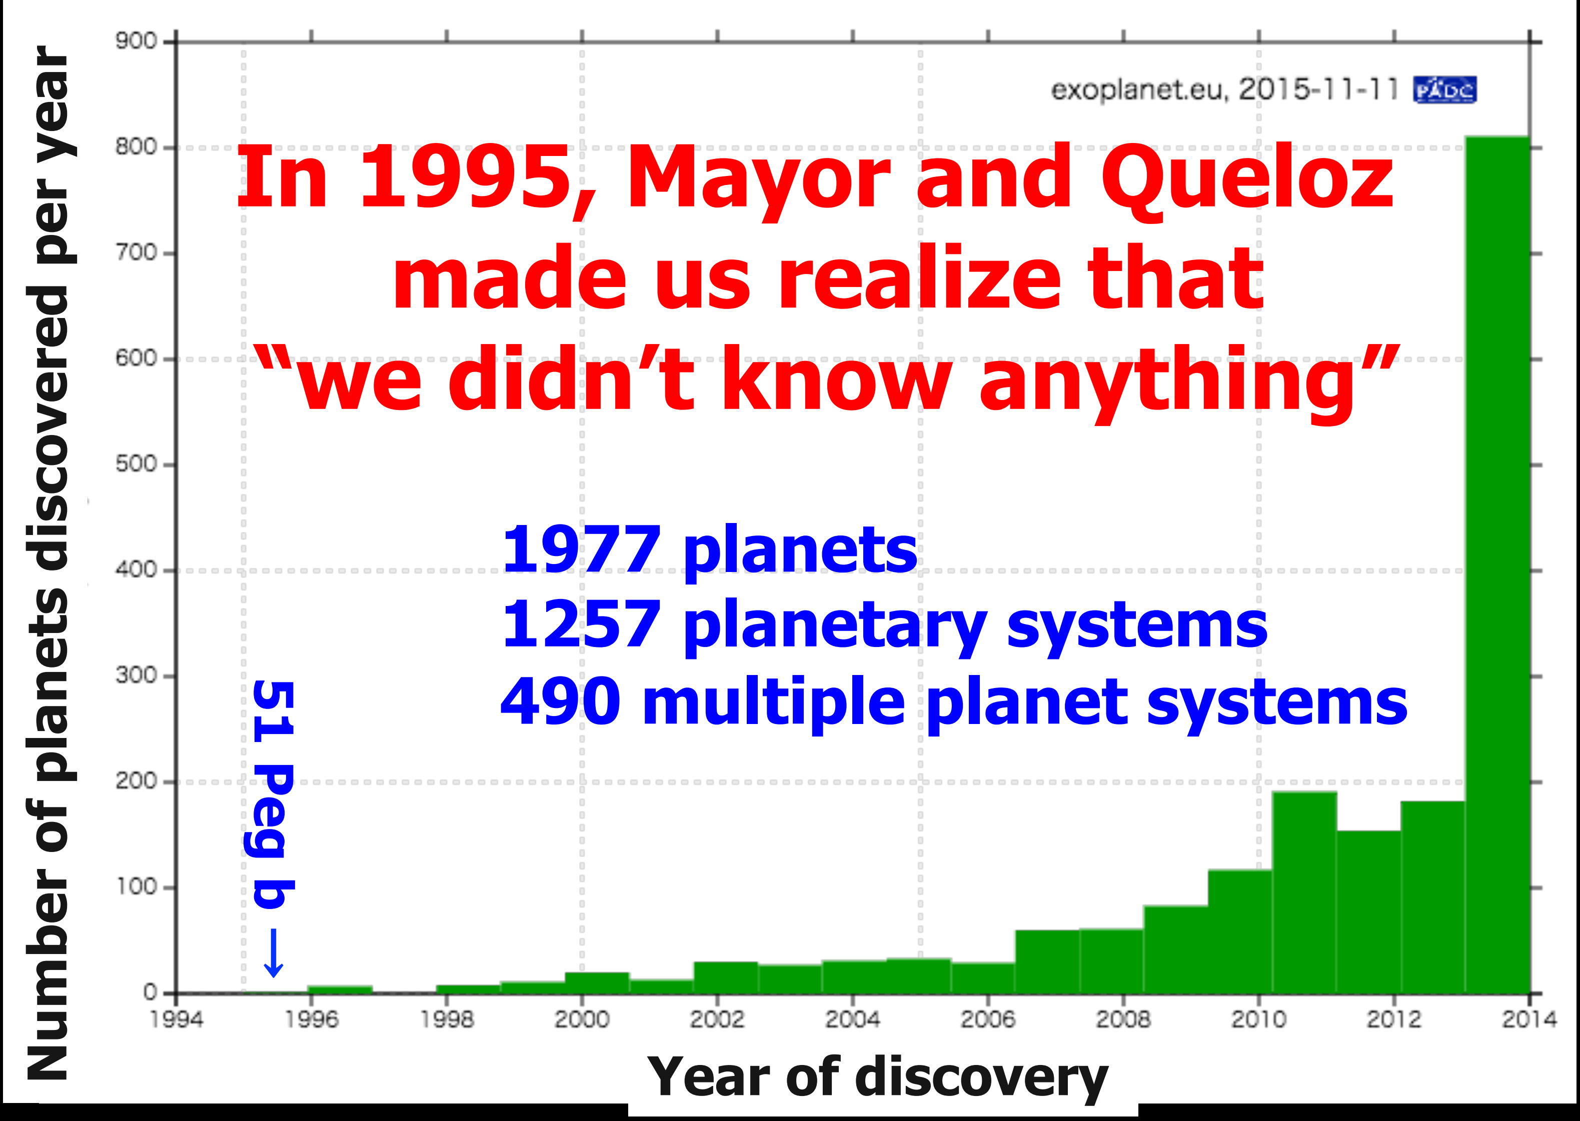
Nightfall: We didn't know anything

A short novel by Issac Asimov

(illustration: Alisa Haba)

- No "night" except the total eclipse due to an inner planet every 2049 years on the planet "Lagash"
- People realized the true world for the first time

History of exoplanet discovery



As of November 11, 2015 http://exoplanet.eu/

Are we alone ?

a Pale Blue Dot ?

or pale blue dots ?

Sciences with exoplanets

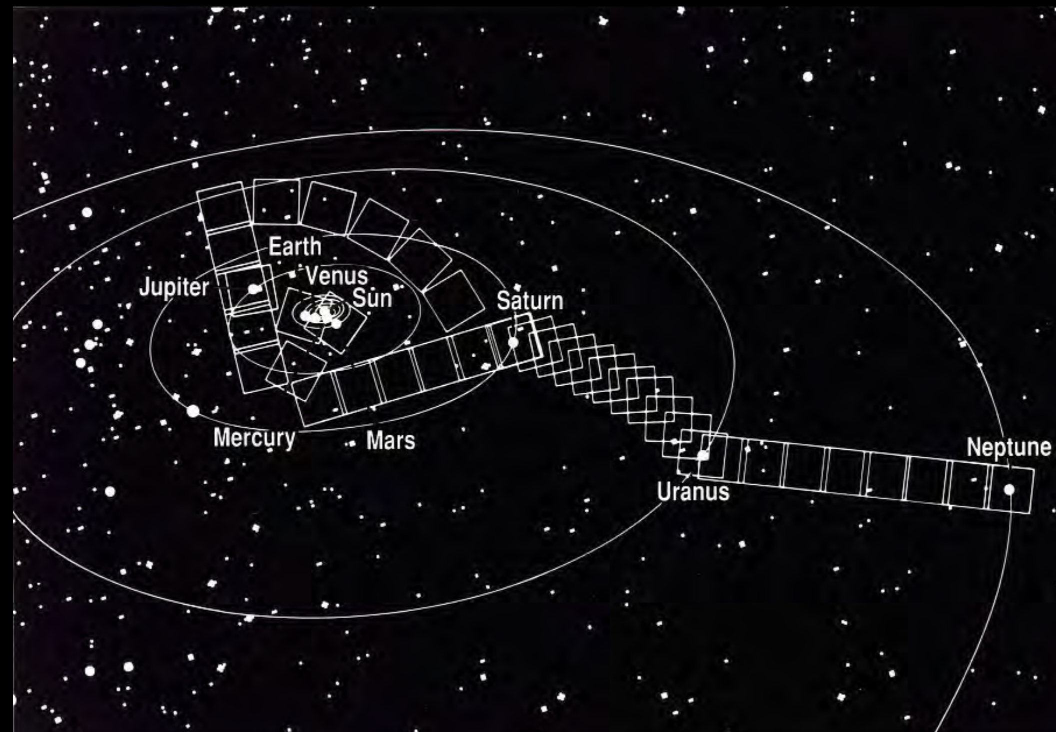
- the ***final*** question: ***Are we alone ?***
  - origin of the earth
  - origin of the Solar System
  - ***habitable*** planets ⇒ origin of life
  - signature of extra-terrestrial life ?

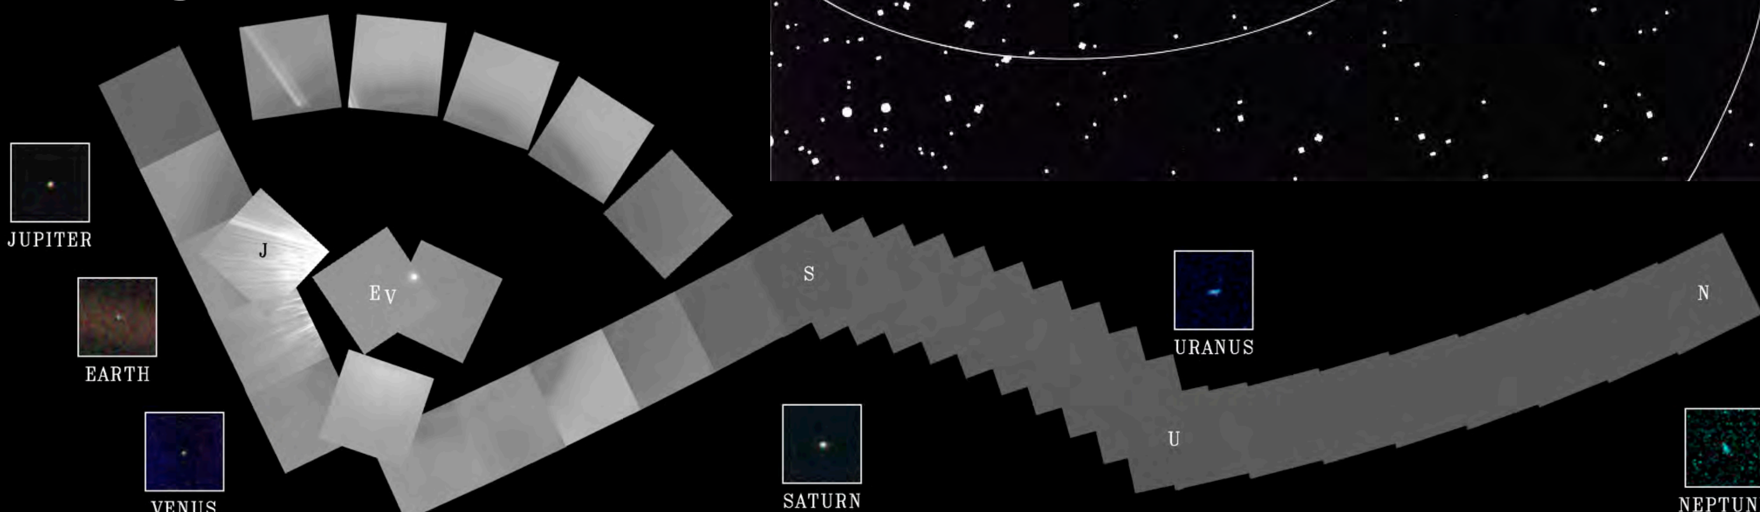
    ⇒ extra-terrestrial intelligence ?

"Where are they ?" E.Fermi (1950)

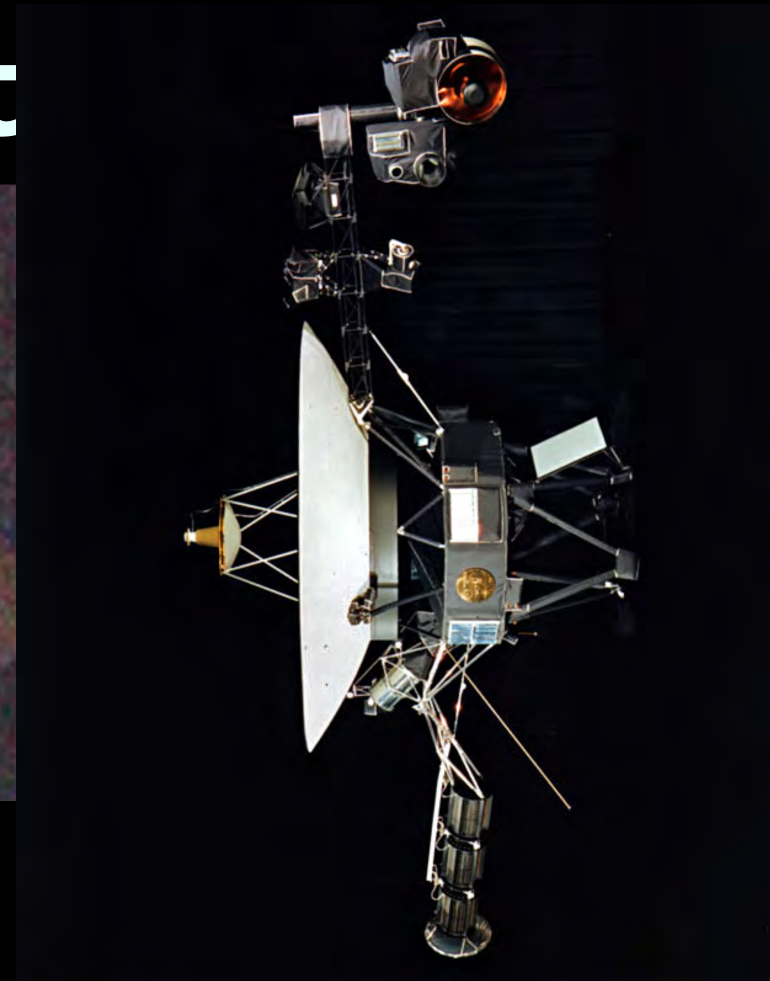
Solar planets imaged by Voyager 1 (February 4, 1990)

- Earth imaged at distance of 40 AU away
- A Pale Blue Dot coined by Carl Segan

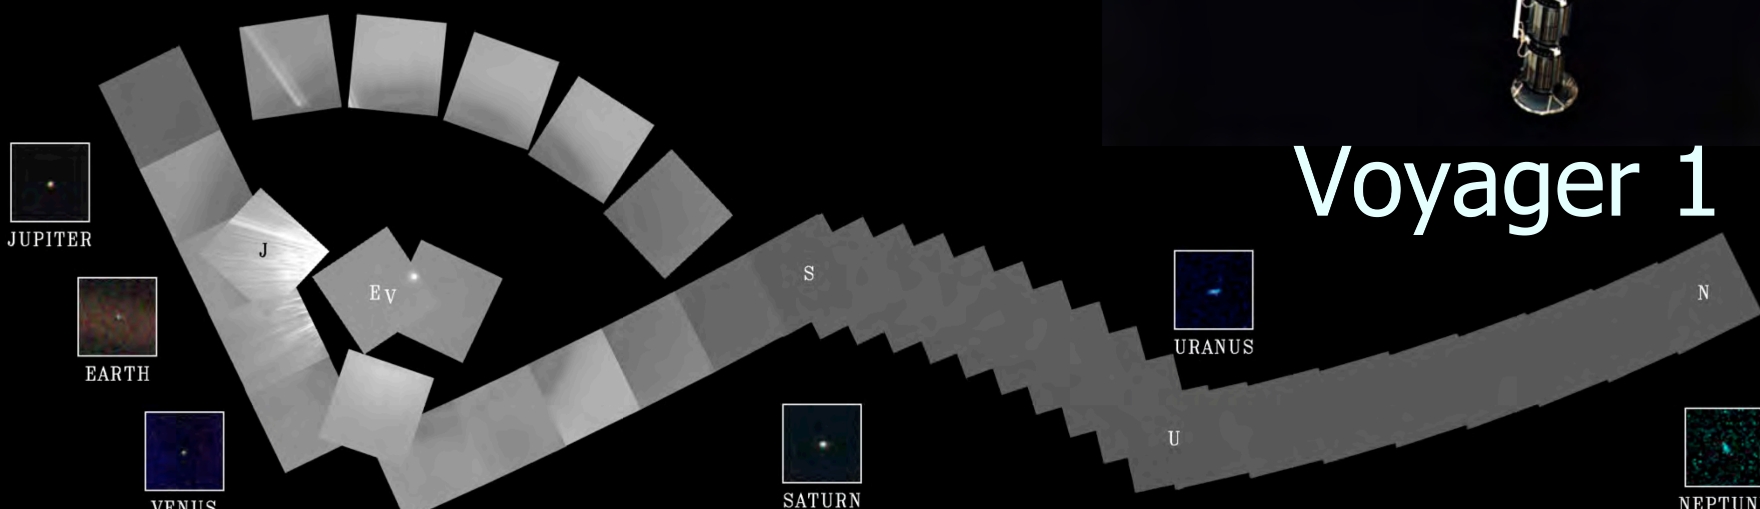




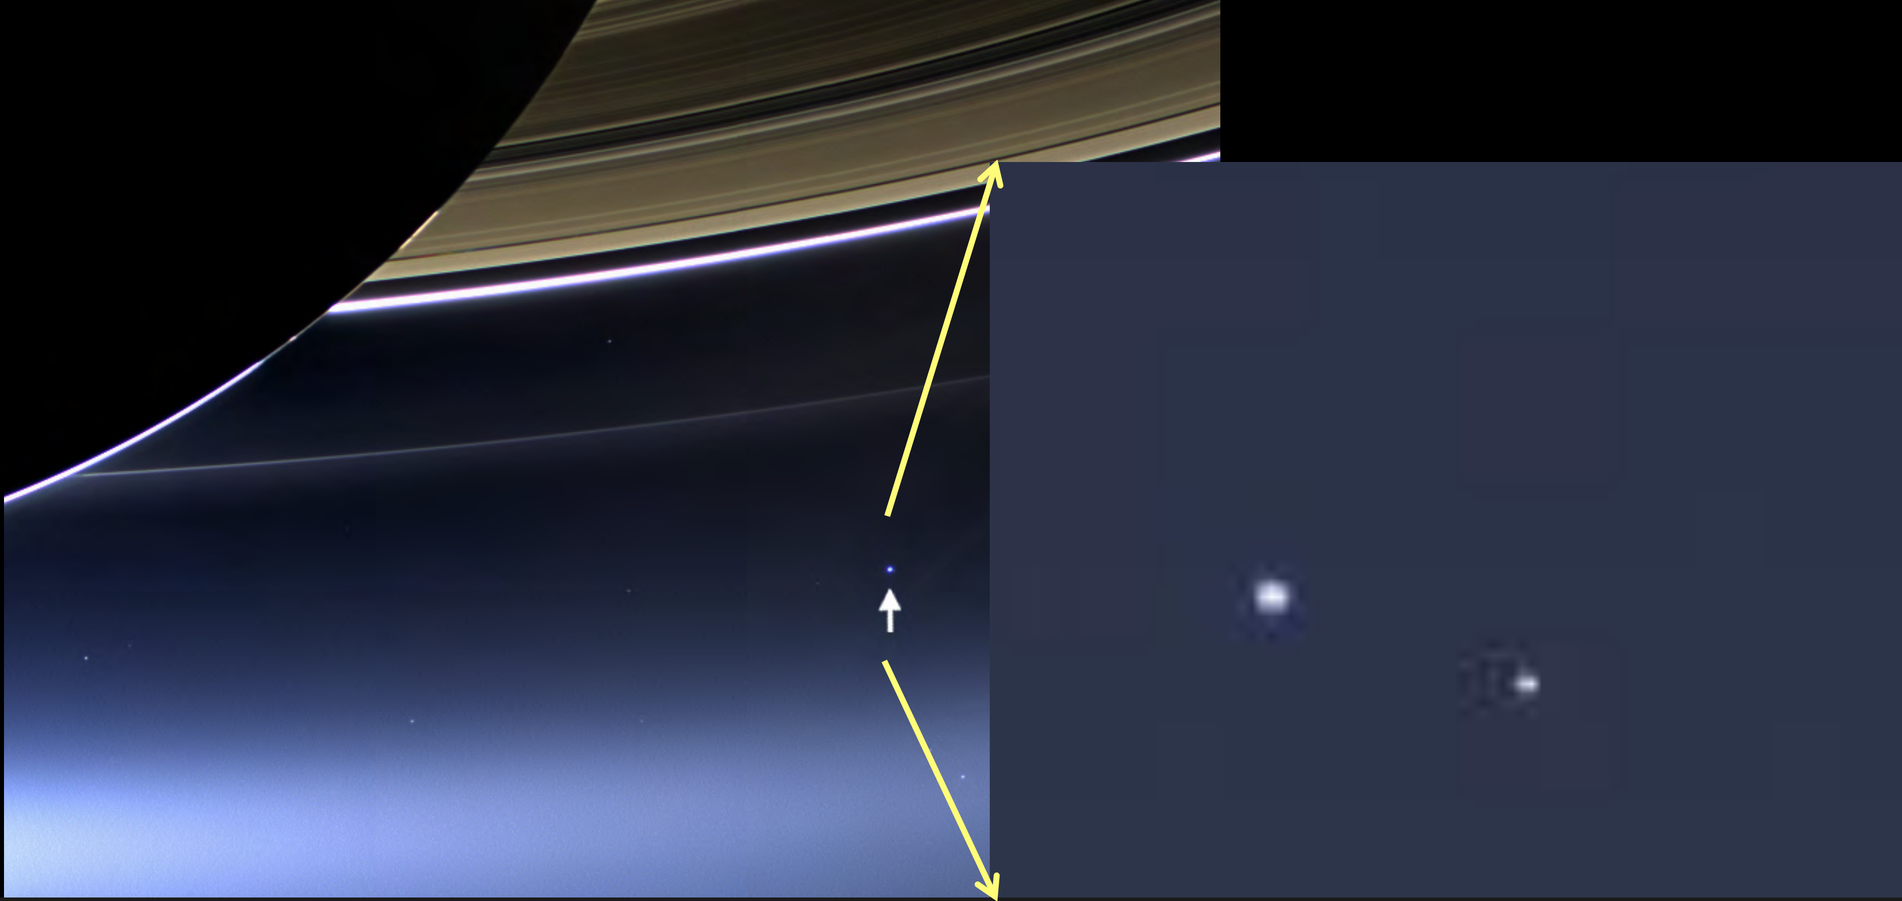
A Pale Blue Dot



Voyager 1



Earth and Moon from Saturn (2013)



- Viewed from *Cassini* on July 20, 2013
  - about 20,000 happy Americans are waving their hand towards Cassini, but *how can we know that ?*

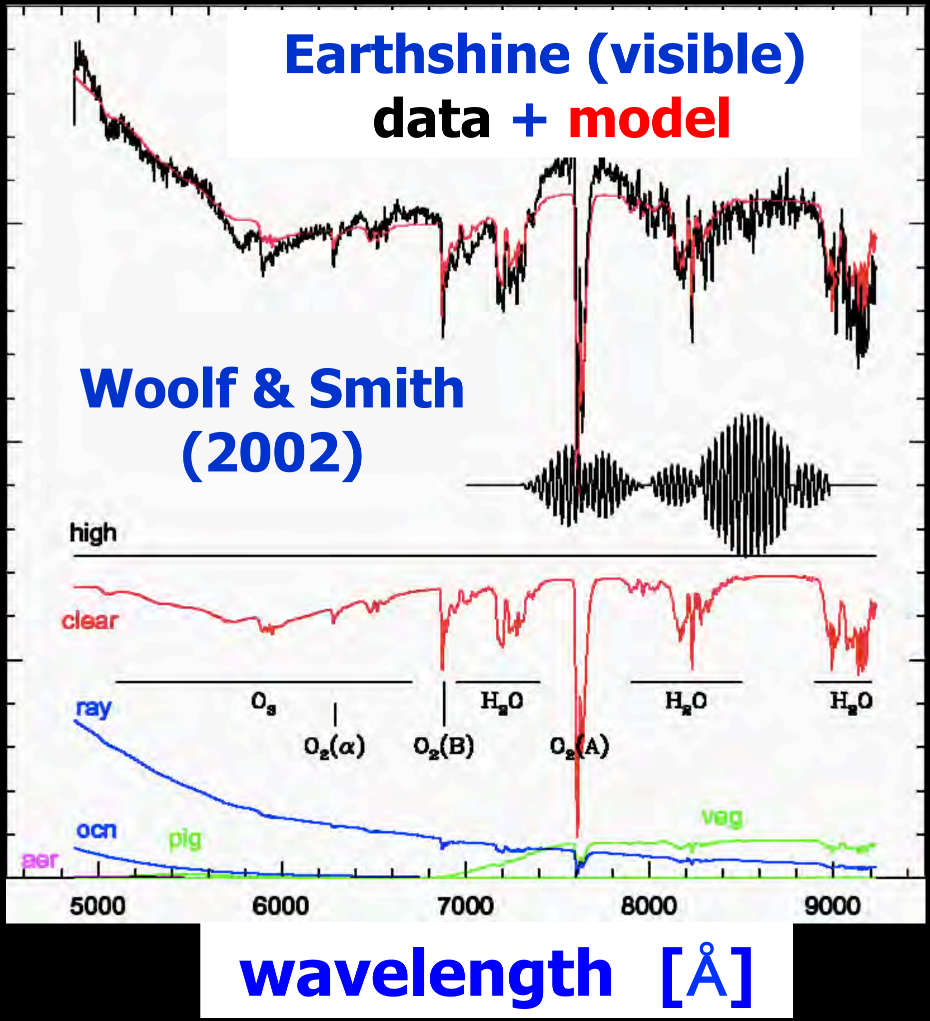
Can we detect signatures of life on our Earth ?

Search for signatures of life on "Earth" with Galileo mission! (1990)

- Launched in May, 1986
- Earth observed on December 8, 1990
- ***Conclusion: it is likely that life exists on Earth !***
  - Abundant O_2
  - Red-edge of vegetation
  - CH_4 abundance out of thermal equilibrium
  - Artificial pulsed radio signal

Sagan, Thompson, Carlson, Gurnett & Hord: Nature 365(1993)715

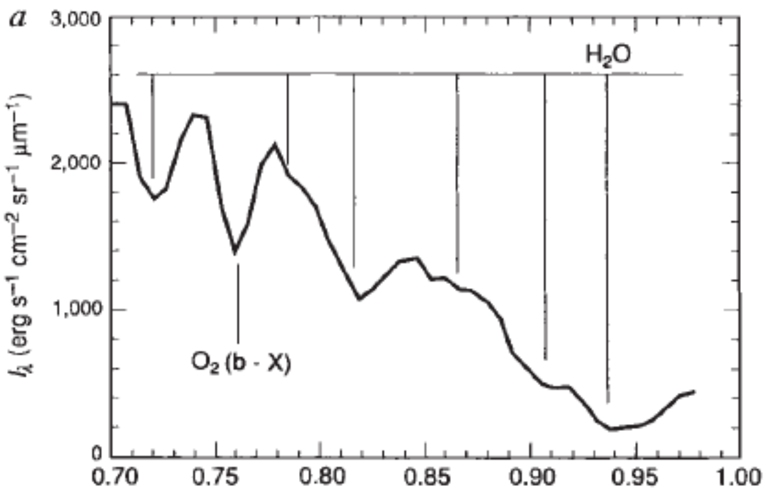
Conventional bio-signatures

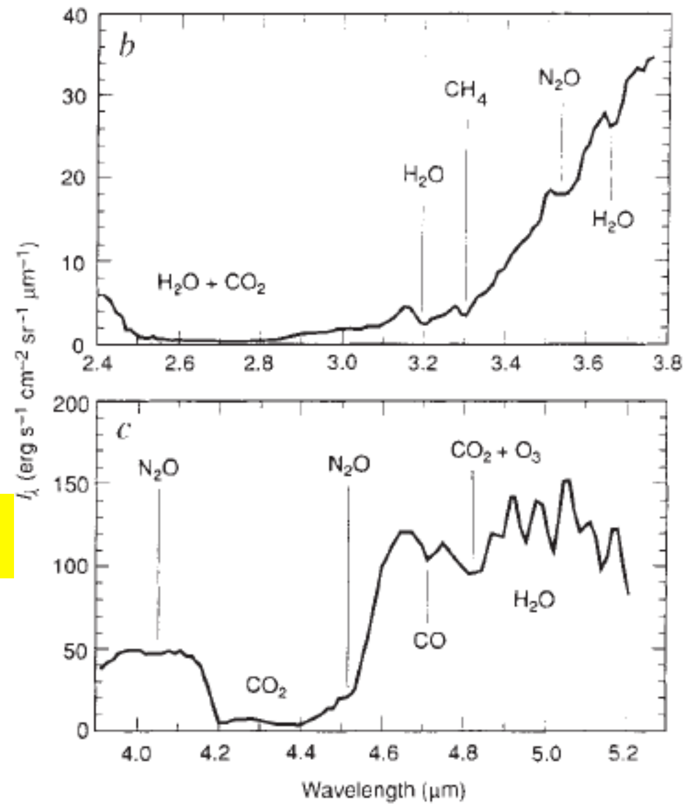


- O_2
  - A-band@0.76μm
  - B-band@0.69μm
- H_2O
  - 0.72, 0.82, 0.94μm
- O_3
  - Chappuis band @(0.5-0.7)μm
  - Hartley band @(0.2-0.3)μm

Kasting et al. arXiv:0911.2936
"Exoplanet characterization and the search for life"

Sagan et al. (1993): spectrum of atmosphere



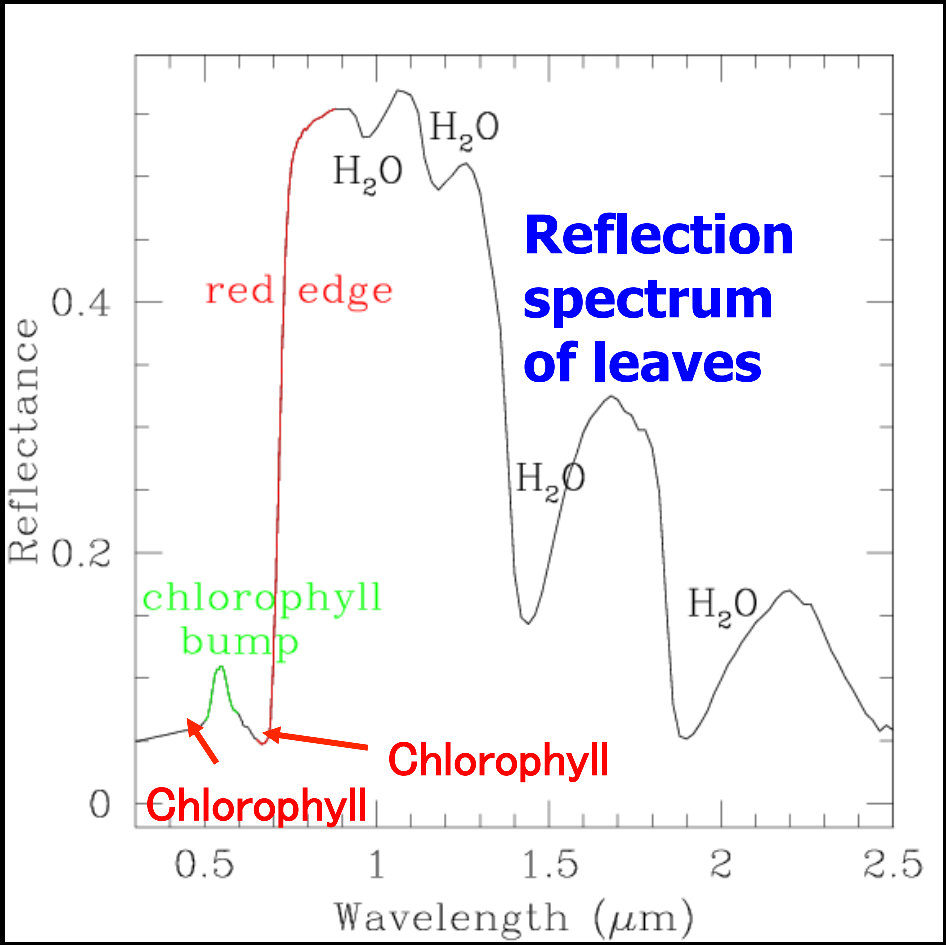


Strong O_2 absorption @A-band(0.76µm)

FIG. 1 a, Galileo long-wavelength-visible and near-infrared spectra of the Earth over a relatively cloud-free region of the Pacific Ocean, north of Borneo. The incidence and emission angles are 77° and 57° respectively. The $(b'\sum_g^+ - X^3\sum_g^-)$ 0–0 band of O_2 at 0.76 µm is evident, along with a number of H_2O features. Using several cloud-free regions of varying airmass, we estimate an O_2 vertical column density of 1.5 km-amagat ± 25%. b and c, Infrared spectra of the Earth in the 2.4–5.2 µm region. The strong υ_3 CO_2 band is seen at the 4.3 µm, and water vapour bands are found, but not indicated, in the 3.0 µm region. The υ_3 band of nitrous oxide, N_2O, is apparent at the edge of the CO_2 band near 4.5 µm, and N_2O combination bands are also seen near 4.0 µm. The methane (0010) vibrational transition is evident at 3.31 µm. A crude estimate[10] of the CH_4 and N_2O column abundances is, for both species, of the order of 1 cm-amagate (≡1 cm path at STP).

Red edge of *(exo)plants:* a possible biosignature in *exoplanets*

- Red-edge
  - Significant increase of reflectivity of leaves on Earth (terrestrial planets) for λ>7000Å
- Widely used in the remote-sensing of our Earth



Seager, Ford & Turner astro-ph/0210277

Vesto Melvin Slipher (1875-1969)

- Discovered redshifts of galaxies and thus cosmic expansion via the Doppler method

"Observations of Mars in 1924 made at the Lowell Observatory: II spectrum observations of Mars"

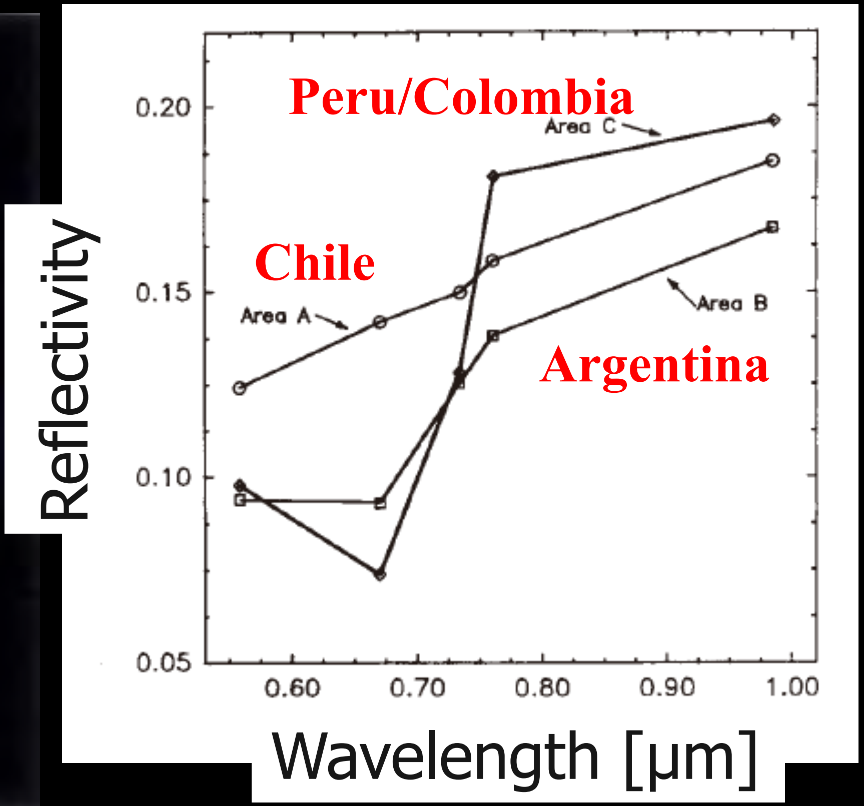
PASP 36(1924)261

reflection spectrum. The Martian spectra of the dark regions so far do not give any certain evidence of the typical reflection spectrum of chlorophyl. The amount and types of vegetation required to make the effect noticeable is being investigated by suitable terrestrial exposures.

Astrobiology indeed in 1924 !

Sagan et al. (1993): colors of the earth

Red-edge of the vegetation on the earth detected by the Galileo mission



Sagan et al. (1993): radio observation

Detection of pulsed radio signals unlikely of natural/astronomical origin

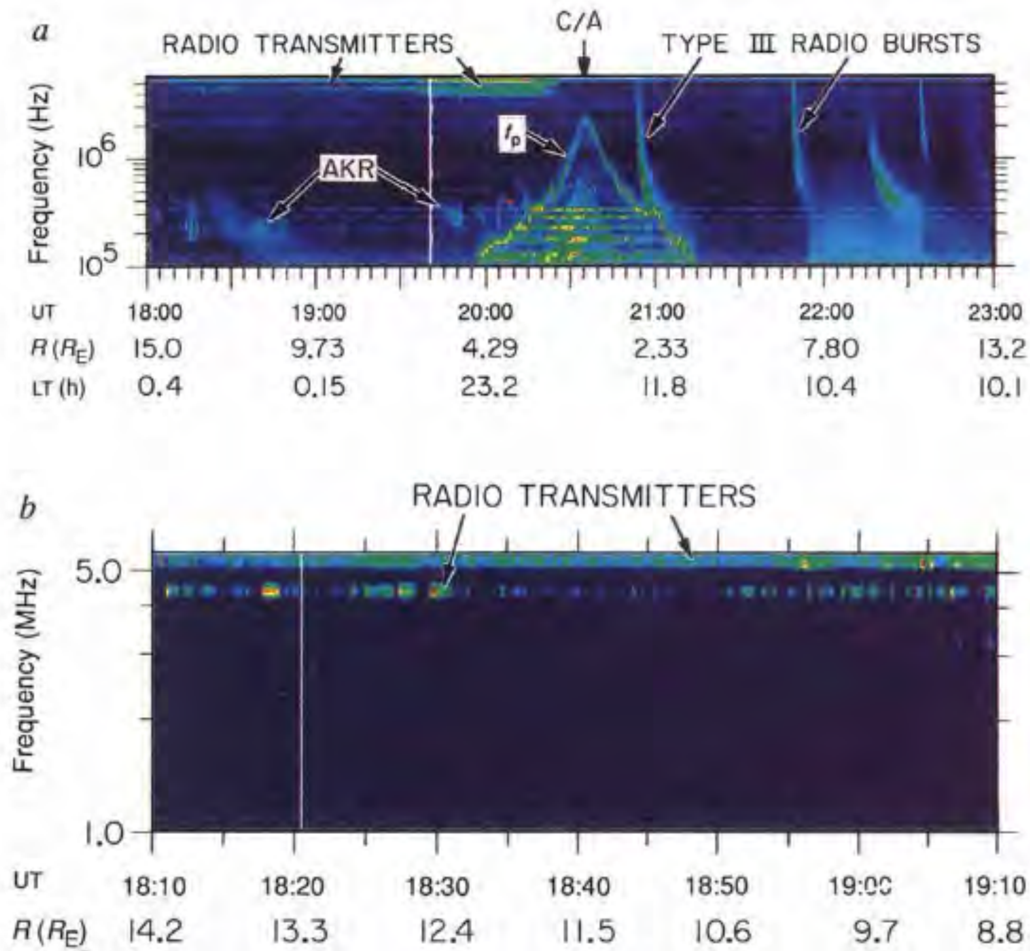


FIG. 4 A frequency–time spectrogram of the radio signals detected by the Galileo plasma wave instrument. The intensities are coded in the sequence blue–green–yellow–red, with blue lowest and red highest. Several natural sources of radio emission are shown in *a*, including auroral kilometric radiation (AKR). Modulated emission at $f > 4$ MHz is shown with an expanded time scale in *b*. Modulated patterns of this type are characteristic of the transmission of information, and would be highly unusual for a naturally occurring radio source. (UT, universal time; *R* is distance of Galileo from Earth in units of Earth's radius, R_E; LT, local time.)

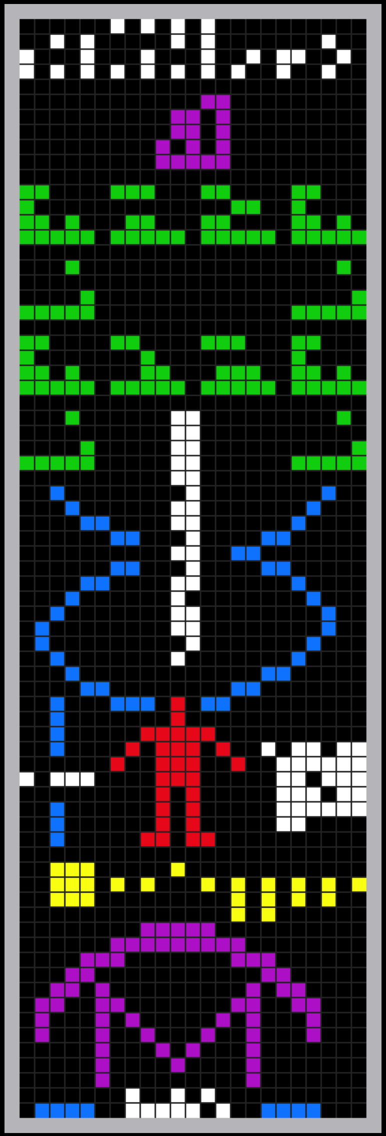
Arecibo message (1974)

- Frank Drake sent a radio message from Arecibo radio observatory on November 16, 1974 towards globular cluster M13 (25,000 light-year away)
- The message, if decoded properly, should look like this.



1 to 10 in binary

Atomic numbers of H, C, N, O, P that form DNA in binary

Formulas for the sugars and bases in the nucleotides of DNA

Double helix of DNA

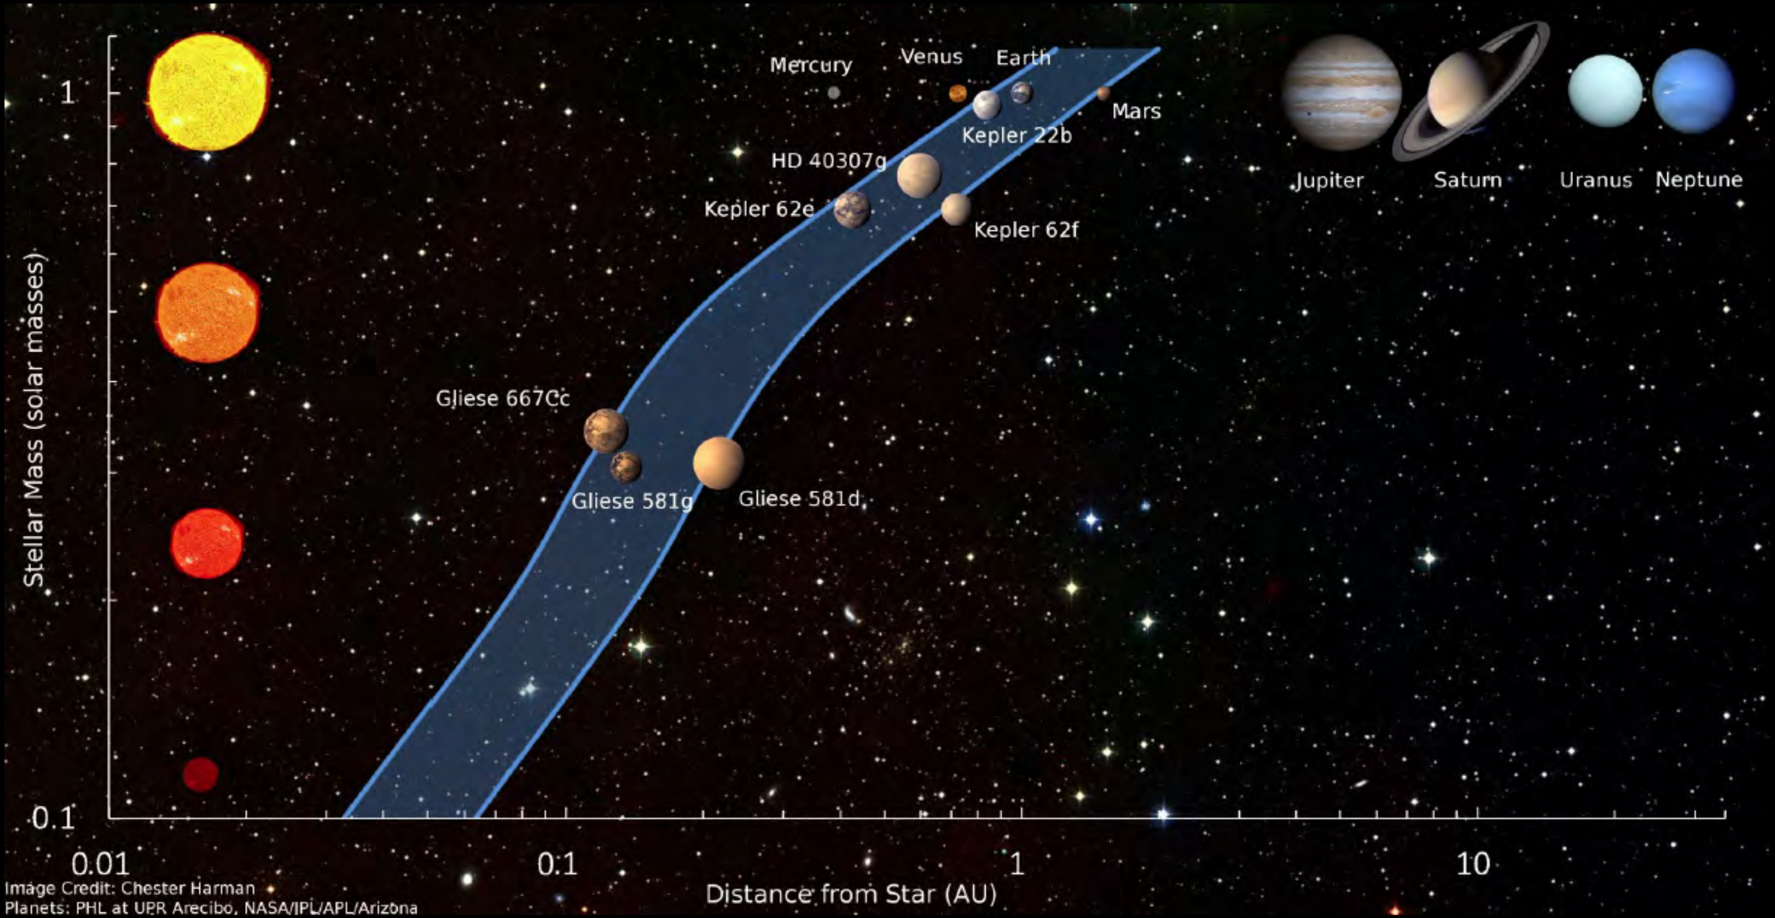
Human and the human population on earth

The solar system

Arecibo radio telescope

Simulated Earth observed at 10pc away

Habitable zone around host stars



Kasting, Kopparapu, Raminez & Harman: arXiv:1312.1328

Occurrence of earth-size habitable planets around Sun-like stars

- Planets with (1-2) Earth radius around GKstars
  - Kepler Transit planets corrected for selection effect
  - 11±4 % (1-4 times the Solar flux on the earth)
  - 5.7+2.2-1.7 % (orbital period of 200-400days)

Table 1. Occurrence of small planets in the habitable zone

HZ definition	a_{inner}	a_{outer}	$F_{P,inner}$	$F_{P,outer}$	f_{HZ} (%)
Simple	0.5	2	4	0.25	22
Kasting (1993)	0.95	1.37	1.11	0.53	5.8
Kopparapu et al. (2013)	0.99	1.70	1.02	0.35	8.6

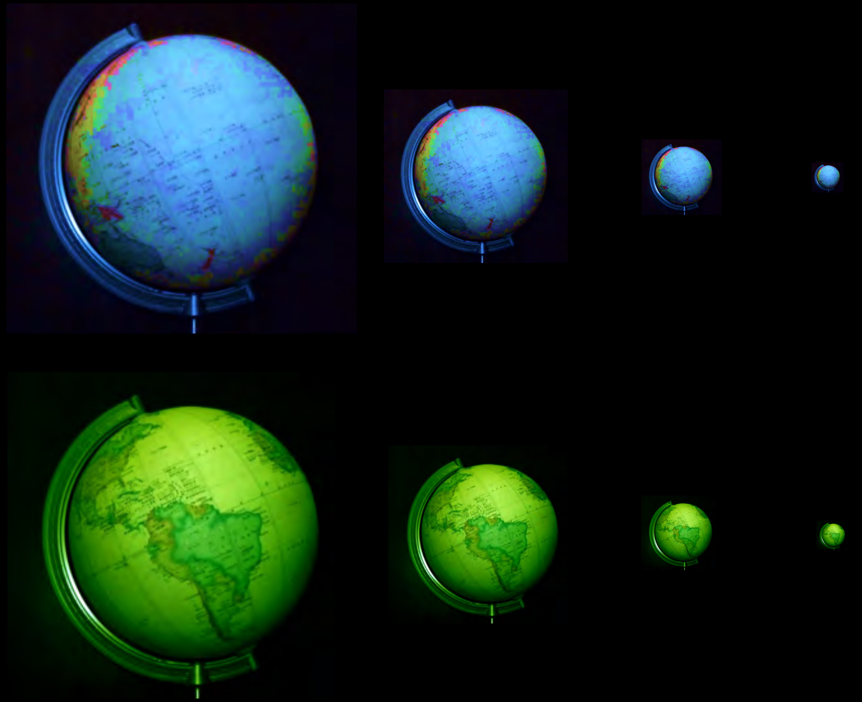
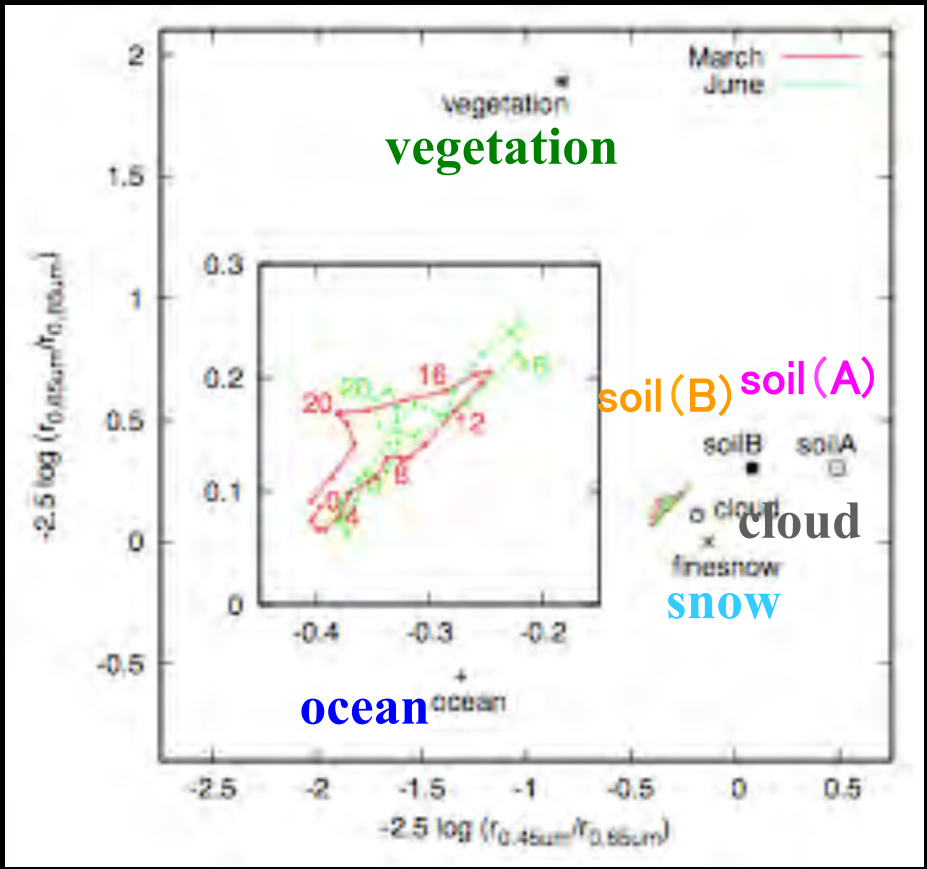
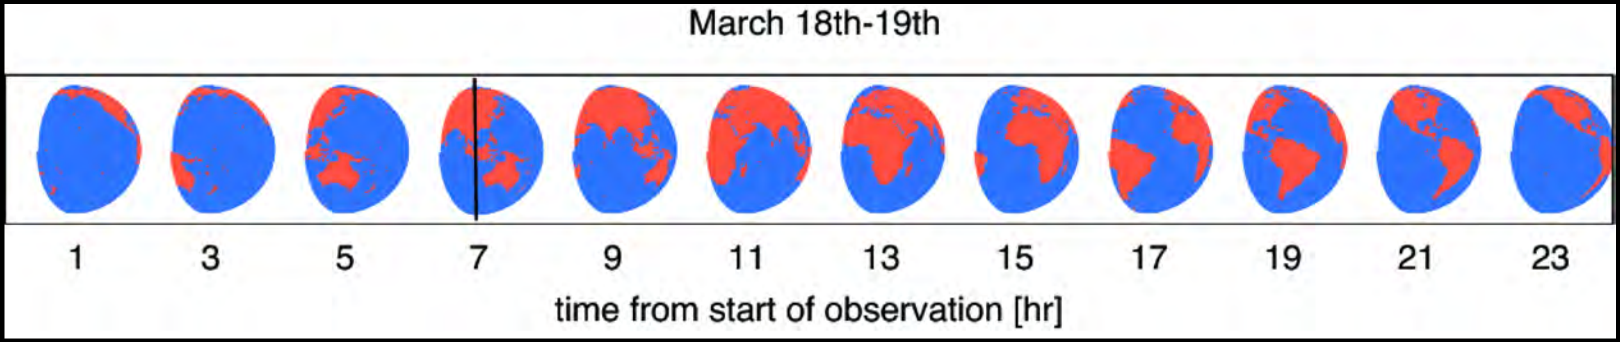
Colors of a second earth

- Beyond a pale blue dot
  - Impossible to spatially resolve the surface of a second earth
  - Color should change due to the rotation
  - A second earth = a color-changing dot

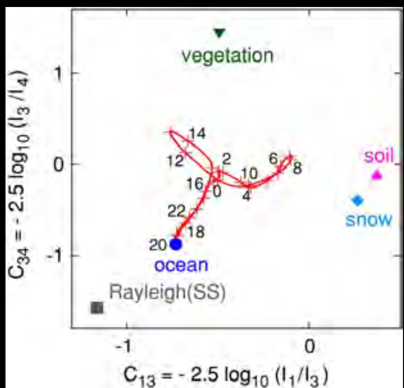


Colors of our earth

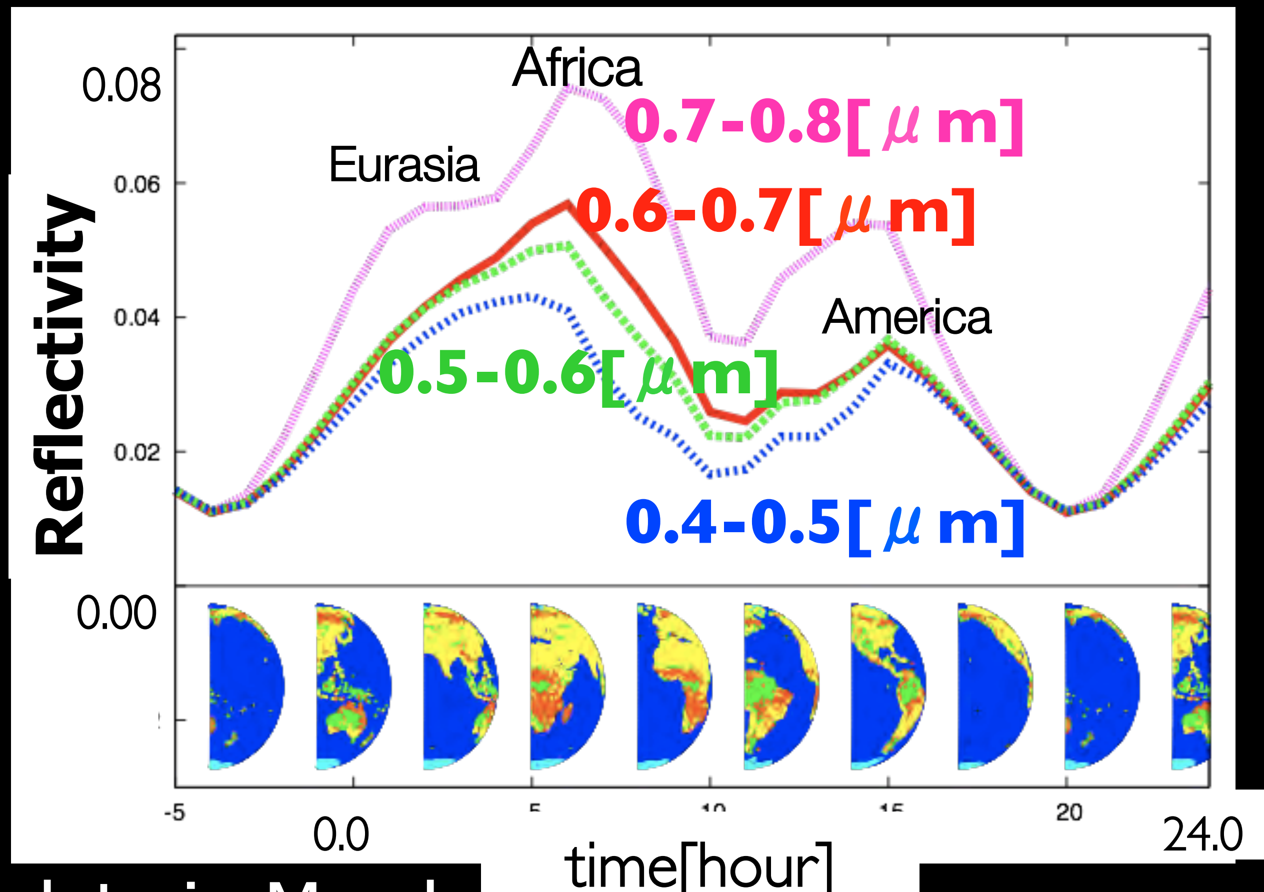




A pale blue dot ? Not really



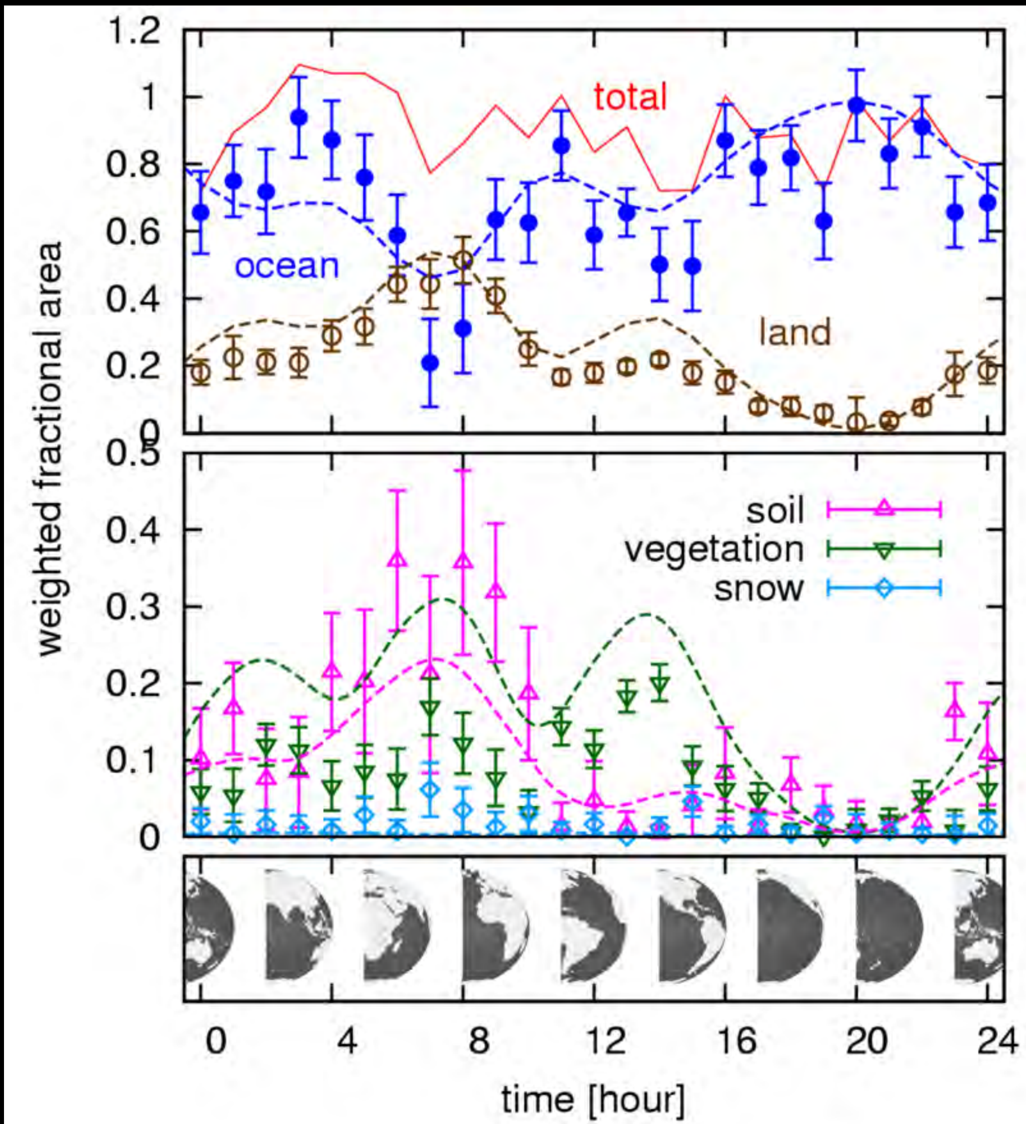
Simulated photometric light-curves of Earth



- Adopted Earth data in March
- Spin inclination = 0 (vernal equinox)
- cloudless

Fujii et al. (2010)

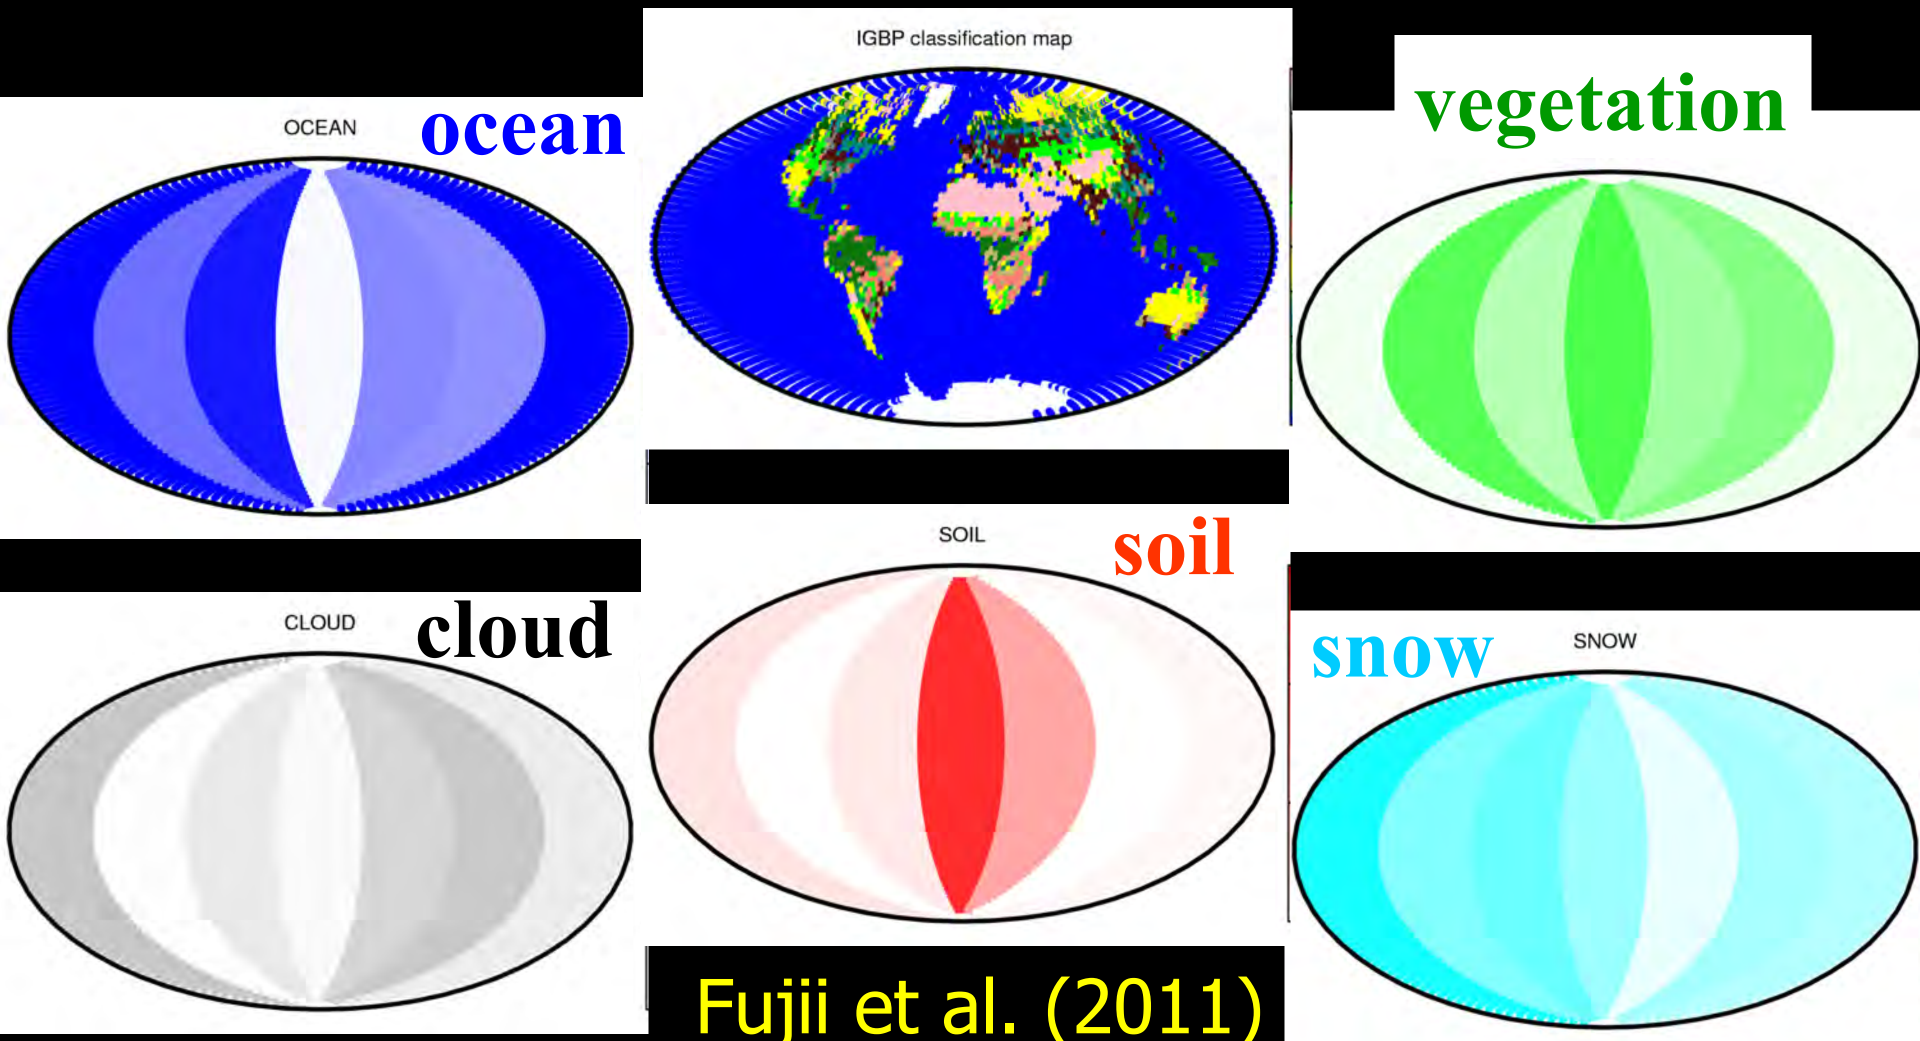
Estimating fractional areas of surface components from colors of a second earth



- 2 week observation of a cloudless Earth at 10 pc away
- Reasonably well reproduced
- possible to identify vegetation !

Fujii et al. (2010)

Surface latitude map estimated from real satellite data with cloud model



Fujii et al. (2011)

"The color of plants on other worlds"
N.Kiang, Scientific American (2008)

Summary: A pale blue dot? Not really !

- Future direct imaging of daily change of colors of another earth is challenging, but would reveal the presence of ocean, land, cloud, and/or even vegetation on their surface
- Detection of a second Earth may not be a mere fairly tale nor a science fiction any more
- Detection of oxygen, water vapor, and even the red-edge may be a promising path towards astrobiology
